

AGRIVIEW™

Simplifies the way you manage levels in grain bins, fertilizer, and fuels.

This software-as-a-service web application is custom-designed for the needs of agricultural cooperatives, seed companies, and suppliers of fertilizers and agricultural chemicals.

Level Sensors Eliminate Climbing

AgriView™ does away with the risky, time-consuming task of climbing ladders to take manual measurements. Level sensors measure automatically, either continuously or at specified time intervals. Non-contact radar, SmartBob, or battery-powered laser level sensors install simply, while wireless devices and gateways cut the cost of installation.

Inventory Levels Always Current

Data is updated each time a sensor takes a new measurement. See how much space remains in a grain storage bin. View how many bushels of grain are available to take to market. Be sure you have the right chemicals on hand to blend the next batch of fertilizer. Everyone with access to the app will be on the same page.

Text and Email Alerts Prevent Problems

Focus on priorities by setting alerts to notify key people via text or email when levels reach a critical high or low point. No need to waste time calling people or tracking them down.

Levels on Your Phone or iPad

The QuickView feature in AgriView™ is a visual snapshot of bin levels. Get instant access when out in the field, driving a truck, or coordinating loading or unloading. Bins are color-coded with a red, yellow, or green alert status that can be sorted by the type of grain, seed, chemical, or fuel they contain.

View silo and tank levels wherever you are at any time of day or night, on-site or at home.

Prevent Overfills & Theft with Automated Alerts

A truckloads feature lets you know how many loads it will take to fill or empty a bin. Drivers can unload without the risk and mess of overfilling. Know how many drivers you need to take grain to market. View time-stamped trends to see when bins were active and detect suspicious activity.

Push-Button Reporting

AgriView™ creates the reports for you. Reports can be exported to excel or PDF files for a specific date range and shared via email. Use trend features to project when bins will be refilled or when chemicals will need to be reordered.

“AgriView™ is for everyone working in agriculture looking for an easier way to manage inventory.”
